

Spring is the season of new beginnings and change. Here at Powerblanket, we try to keep that same philosophy when it comes to the evolving needs of process heating. Our engineers are always looking for new ways to improve our products and expand the way we approach freeze protec-

tion, and industrial heating. While some changes can be big and revolutionary, others are simpler, yet still effective.

This year we are excited to be expanding our product offerings to include blankets with higher heating capabilities, improved flexibility, and more convenient control. We will also be offering accessories that will improve the efficiency of our drum and hot box heaters.

Each year, we learn more and more from our customers about the industries they work in and how they use Powerblanket products to keep things operating smoothly. As we get more familiar with already familiar applications, and discover new ones, we apply the things we learn to make sure that every blanket and every wrap and heater we build will meet the needs of our customers, no matter where it is used. Stay tuned for our upcoming announcements!

Concrete Curing Blankets

Pouring concrete in the springtime shouldn't be anything to worry about. Despite occasional cool temperatures, scheduling out jobs is easily manageable, until Mother Nature pulls a fast one and decides that winter isn't quite over. Pouring concrete in winter weather is never fun. When you use concrete curing blankets, you can remove any of the seasonal weather surprises from the equation and keep your job schedule full.

Propane Tank Heating Blankets

Unless you're a diehard griller, you probably haven't seen your barbecue since last year, and you're probably getting anxious to break it out again. If you're cooking with propane, the temperature fluctuations that come with springtime can severely limit the use you'll get out of your tank. As temperatures drop, propane won't flow like it's supposed

to, and it will seem empty when it's only half full. With propane tank heaters, outside temperatures will no longer affect the efficiency of your propane flow, ensuring you can grill to your heart's content, or at least until the tank is truly empty. Save time and money this spring, and later this fall, by getting the most out of your propane tanks with Powerblanket.
